Conversation 1: Choosing a Project Idea

User:
I need to come up with an idea for my final programming project. I want to make something useful for college students that helps them stay organized.

ChatGPT:
One possible idea is a Study Planner website. Students could enter assignments, organize them by subject, add due dates, and track which assignments they have completed. You could also include study goals and a progress page.

User:
I like that idea. I want students to be able to enter due dates, organize tasks by subject, and see when assignments are completed or almost done.

ChatGPT:
That would give your website a clear purpose. You could create an Assignments page, a Study Goals page, and a Progress page. A Home page could connect all the sections.

Conversation 2: Planning the Website

User:
What pages should my Study Planner website have?

ChatGPT:
I recommend these pages:

1. Home – Main navigation page.
2. Assignments – Displays saved assignments.
3. Add Assignment – Allows users to enter new assignments.
4. Study Goals – Displays study goals.
5. Add Study Goal – Allows users to create goals.
6. Progress – Shows completed assignments and goals.

Each page should have navigation buttons that allow users to move around the website.

User:
What information should I store in State?

ChatGPT:
You could store a list of assignments, a list of study goals, the selected subject, and a message for the user. You can also use dataclasses to organize the information for each assignment and study goal.

Conversation 3: Creating the Mockup

User:
Help me create a mockup of my planned website. The assignment requires page layouts, buttons, navigation arrows, route names, parameters, and State fields.

ChatGPT:
Draw each page as a rectangle. Put the page title and its buttons inside. Connect the pages with arrows to show where each button leads. Label each page with its corresponding route name.

For example, the Home page should connect to Assignments, Add Assignment, Study Goals, Add Study Goal, and Progress.

User:
What should I include on the Assignments page?

ChatGPT:
Include assignment titles, subjects, due dates, and completion status. Add buttons for creating an assignment and returning to the Home page.

Conversation 4: Understanding Python and Drafter

User:
I need to build my website using Python and Drafter. How should I organize my code?

ChatGPT:
You can use dataclasses to represent individual assignments and study goals. Your State dataclass will store the information that needs to remain available as users navigate between pages.

You will also create Drafter routes for the different website pages and actions.

User:
What should my Assignment dataclass contain?

ChatGPT:
An Assignment dataclass could contain:

- `title: str`
- `subject: str`
- `due_date: str`
- `completed: bool`

A StudyGoal dataclass could contain a description, subject, and completion status.

Conversation 5: Adding Website Features

User:
How can I let users add assignments to the website?

ChatGPT:
Create a page with input fields for the assignment title, subject, due date, and completion status. When the user submits the form, your route should create an Assignment object and add it to the assignments list in State.

User:
How can users mark assignments as completed?

ChatGPT:
You can create a route that receives the index of an assignment. It can update that assignment's completion status in the State list.

User:
How can I show the user's progress?

ChatGPT:
You can loop through the assignments and study goals, count how many are completed, and compare those totals with the total number of items.

Conversation 6: Deploying the Website

User:
How do I deploy my website using GitHub?

ChatGPT:
First, upload your Python project files to a public GitHub repository. Then follow your course's deployment instructions to publish the website. Once deployment is complete, open the public website URL and test that the pages and features work.

User:
What should I submit?

ChatGPT:
Submit the public URL of your deployed website. Also make sure your repository contains the required project files, design worksheets, planning worksheet, and LLM conversation documentation.
